Bosch axxis dryer filter cleaning

d WARNING! RISK OF EXPLOSION! Never use solvents or highly flammable liquids for cleaning. CAUTION Incorrect cleaning may damage the dryer. Do not spray with a water jet. Do not use scouring agents or all purpose cleaners. Do not use steam cleaners. Wipe the housing and fascia with a soft cloth and soapy water only. Wipe the drum, door seal and inside of the door with a damp cloth only. Immediately remove washing and cleaning agent residue. A dirty filter extends the drying time and increases energy consumption. The filter should be cleaned before and after each drying process, however at the latest when the Filter indicator light illuminates. If the Filter indicator light illuminates during a drying program, clean the filter immediately. i The program interrupts automatically. 1. Switch off the dryer. Program selector to Off. d The inside of the door heats up during the drying process. ! 2. Open the door. 3. Pull out filter... 4. ...and open. CAUTION 5. Remove fluff (run hand over filter). The filter should be rinsed once a year under warm running water. The filter must be dried thoroughly before being replaced. 6. Close filter and re insert. 7. Close the door. 19 Hi, I just moved into an apartment that has a Bosch Ascenta ventless dryer. The previous tenants didn't do much maintenance on it so there's a lot of lint everywhere. I was able to clean out the lint filter and condenser unit but don't know how to remove the panel on the lower right. Using a flashlight I can see a lot of lint stuck in the exhaust vent. Is there any way to pop this panel open? There is also a strong scented odor which I'm guessing is from dryer sheets. I wiped the interior and surfaces with vinegar but the odor still remains. My guess is that the residual lint behind the lower right panel is contributing to this as well?? Any tips to remove odor would be great as well. Thanks!! When you invest in a Bosch dryer you expect it to deliver with dry clothes in a reasonable amount of time. So when your Bosch dryer takes too long to dry it can dampen your spirits as well as your clothes. But don't despair; sometimes cleaning your lint screen or moisture sensor is all it takes to fix a Bosch dryer not drying completely. 5 Reasons Why Bosch Dryer Takes Too Long to Dry We depend on our appliances so much that when they don't perform we often fear the worst. But our Bosch tumble dryer troubleshooting reveals that when a dryer takes too long these common reasons have simple fixes. Overloading with Clothes Overloading your dryer is one of the most common reasons you have a dryer taking multiple cycles to dry. With so many clothes crammed into the dryer, the hot air has limited room to circulate and drying takes longer. Not to mention that too many clothes can strain your dryer components and pave the way for a breakdown. We recommend referring to your owner's manual for the manufacturer's guidelines re; your dryer's capacity. Adhering to these guidelines and drying two loads instead of one that is overloaded can save you time and a repair. Lint Screen Needs Cleaning Warm dryer air picks up lint as it tumbles clothes. The lint screen in your dryer prevents this lint from being trapped in your dryer vent. A buildup of lint in the screen limits air circulation and could be why your Bosch dryer takes too long to dry. But lint buildup could also cause lint to accumulate in your dryer vent, putting you at risk for a dangerous dryer fire. Since the lint screen is your first line of defense in preventing this outcome, it's recommended that you clean your lint screen after every drying cycle. This is easily done by removing the screen and peeling away any lint with your hand or a paper towel before replacing it. Clogged Dryer Vents Even if you clean your lint screen regularly, lint and other debris can accumulate in your dryer vents over time. While clogged dryer vents are a common reason why your Bosch dryer takes too long to dry, they're also a common source of dryer fires. We recommend cleaning your dryer vent once or twice a year with these simple steps: Move the dryer away from the wall and disconnect the power source. Remove the lint screen and vacuum out the area around the screen with a narrow hose attachment. Disconnect dryer ductwork and vacuum inside it with the narrow hose attachment. You can also use a dryer brush kit. Vacuum or brush away any lint from around the ductwork, as well as the duct on the outside of the house. Reassemble ductwork. Reconnect dryer. Moisture Sensor Needs Cleaning A dryer's moisture sensor monitors the dampness in clothes and adjusts the drying time, preventing over or under drying. The moisture sensor is typically located near the lint filter and, over time, can become dirty with lint and other debris. When this happens it can't accurately sense the dampness in clothes, resulting in a longer drying cycle. Fortunately, cleaning the moisture sensor can restore its function. We suggest wiping it down with a cloth dampened with water and white vinegar to remove lint and residue. Allow the sensor to dry completely before replacing it. Broken Dryer Heater This is one of the most common causes of a Bosch tumble dryer not drying properly. The heating element in your dryer is what warms the air before it enters the dryer drum. It's located behind the dryer drum or behind a separate panel in the back of the dryer. Over time, it can wear out and you'll notice your Bosch dryer not heating appropriately. A broken dryer heater cannot often be repaired and will need to be replaced. We recommend using a professional service for this complex repair. Advance Appliance Service has long been the Nashville area's first choice for a professional Bosch dryer repair service. If your Bosch dryer takes too long to dry even after trying these methods, give us a call to set up a repair. Cleaning your dryer and providing regular maintenance is important to help keep it running efficiently. Lint-clogged dryers take longer to dry clothes which means you will spend more electricity. Cleaning your dryer on a regular basis could help you save money. How to clean your dryer's exterior To clean your dryer's exterior, simply wipe it down with a damp cloth. How to clean your dryer's interior To clean the lint filter, pull out the filter and remove the lint. Wash the filter gently under running water to remove any additional lint and allow it to completely dry. Reinsert the filter into the dryer. For instructions on how to clean the condenser, visit this page. To clean the moisture sensor, wipe it down with a damp cloth and a little bit of white vinegar. The sensor is located next to the lint filter. Need further assistance on the dryer maintenance process? Make sure to check our resources: Home - Laundry The lint filter on a Bosch dryer prevents lint from exiting the dryer through the air outtake hose and vent. As moist, hot air leaves the dryer, lint in the hose or vent can block the flow of air and reduce the dryer's efficiency, or cause dryer malfunction. The filter sits in a lint filter compartment inside your Bosch dryer, near the door. It's important to clean the filter after each dryer cycle, or before the next cycle. Routine Cleaning Open your Bosch dryer's door. Locate the lint filter at the bottom of the door opening. Lift the lint filter slowly up and out of the lint filter compartment. Hold the lint filter over a trashcan. Rub your hand gently over one side of the mesh surface of the filter to dislodge the lint into the can. Turn the filter over and repeat. Set the filter aside. Attach a brush or crevice tool to your vacuum cleaner and vacuum away any lint inside the lint filter compartment or that is blocking the compartment's moist air intake vent screen(s). Slide the lint filter into the filter compartment and close the dryer door. Deep Cleaning Wash the lint filter at least once a month if you use dryer sheets. Remove the filter from the machine and clean it as in Section 1, then soak the filter in a sink of warm, soapy water for about 10 minutes. Scrub the filter gently with a toothbrush to remove the dryer sheet film that can accumulate on the mesh. Rinse under warm running water. Blot away any excess water from the filter with a towel. Air-dry the filter completely before returning it to the dryer.
